

Red Hat Ansible : The Next Level

Logging Debug Statement : Playbooks

Ansible Automation

- User needs to put some debug information/print information while executing the stuff.
- Ansible use **debug module** for such print statements.
- **debug Module** is helpful for debugging variables and expressions.
- **debug Module** accepts three parameters.
 - **msg** - print or logging statement
 - **var** - variable which value user wants to print
 - **verbosity** - Define verbosity of messages.

Thank You...
